

Parallel Git Workflow

on Pantheon

On Pantheon, the Dev, and Test tabs use the same branch as Live (master). This is an old “gitflow” inspired configuration that causes friction with multiple developers, or when tasks get delayed somewhere in testing or approval process. We can use multidev environments to create a Parallel workflow and ignore Dev and Test tabs in the dashboard. Instead use `develop` and `stage` branches and keep your code clean and deployment frictionless. <https://calvint.com/blog/parallel-principle-git-workflow>

Simply merge features into the correct branch for the desired purpose; dev/qa test, approval, production. No feature will hold up another feature and there's no confusion to the state of code if you come back to it after some period of time, or new devs onboard.
